

PATCHED PRINTERS ARE HAPPY PRINTERS

Researchers found exploitable vulnerabilities in over 150 HP multifunction printers. Here's what an attack could look like...

Attacker manipulates victim into visiting malicious website they control

Malicious website automatically exploits vulnerabilities on target MFP

Successful exploit gives attacker control of compromised MFP

Attacker quietly steals information or penetrates further into their victim's network

Avoid unpatched printer problems by following these steps...

PATCH!

Limit and monitor physical access to MFPs

Segregate MFPs into their own firewalled VLAN

Follow vendor-supplied best practices and settings
